Name: _____ Datum: _____

Aufgabe D004:

Accounting department needs to send some documents to all employees. They asked you for help. Create a program-analyzer that will read three text documents and will create a list of three values tuples.

There are three text documents that store following information:

1. First and last names of users;
2. email addresses of users;
3. list of files paths, that should be sent to users.

Lists contains information in randomly saved way. Name in first list can match with email address in the middle of second list and with last file path from third list. Any order is possible.

The task is to parse all three files, applying math criterion, in order to combine them in the following way:

<User first and last name>, <email address>, <file to send>.

Example: John Stone, J.Stone@dundermifflin.com, C:\FirstGroup\John_Stone.pdf

In case when tuple can't be fully created, complete it with null value, for example:

<John Smith>, <null>, <null>, or <null>, <j.osbourne@corp.it>, <null>.

The result of the program should be saved in such a way that in the future this file can be used for further parsing and processing.

Example of three text files:

Users names list:

1. Tamzyn French
2. Salome Simoes
3. Jane Meldrum
4. ...

List of e-mails:

1. J.Stone@dundermifflin.com
2. PiePriya@dundermifflin.com
3. M_Wong@dundermifflin.com
4. ...

List_of_files:

1. C:\Second Group\A.Kazantzis.txtex
2. C:\FirstGroup\P.Stanbridge.pdf
3. C:\Secon Group\Jane_Meldrum.xml
4. ...
